

HOW TO ESTABLISH A SUCCESSFUL MILLBORN CRP STAND.

Having healthy expectations is key to achieving a successful CRP stand. Following the below steps is extremely important. With that being said, we also understand that there will be questions along the way, and we are more than happy to help answer any and all of them.

1

Select the correct Millborn CRP mix.

If you are unsure which mix will meet your specific needs, allow us to help.

Timing of seeding

The two primary seeding windows are Spring and Dormant. We fine tune our mixes depending on your desired seeding time.

1.5 months after application of Plateau®

4.5 months after application of Plateau®

We always recommend using Plateau® on Conservation mixes that are comprised primarily of native grasses.

Seeding technique

We recommend using a drill capable of placing the seed no deeper than 1/3". We have found Truax and Great Plains drills to be the best for seeding native grasses and forbs.

4

2

Proper seedbed preparation.

Ultimately, you want a clean, weed-free seedbed to plant into.

Ideal seedbed

Soybean stubble offers a firm seedbed to promote a uniform and successful stand.

Not ideal seedbed

Failure to properly prepare your seedbed can result in soil that isn't uniform, ultimately leading to unsuccessful stands.

Post seeding management

Every project's post seeding management is unique. We are here to guide you through the steps for a successful stand.
