## PHEASANT PHEAST

- Desired by upland birds
- Provides birds with daily energy and a protective structure for survival

Pheasant Pheast is desired by upland game birds because it provides them with daily energy and a protective structure for survival. Its seed will become sweeter in taste as the plant matures.

### AGRONOMICS

Seeding Depth	1/2 inch
Seeding Rate	<b>Drilled:</b> 8 lbs/acre <b>Broadcasted:</b> 12 lbs/acre
Planting Time	Late Spring (when soil temperatures reach 60 degrees F)

\*Don't jump the gun and seed too early in the spring. Sorghum is a warm-season species and will not respond well at all to cold temperatures after establishment. The quick maturing varieties allow for plenty of time to reach seed production before hunting season.
